Getting Started

Add Stylized Clouds to Your Scene

To add stylized clouds:
Right-click in the Hierarchy.
Navigate to **Cloudscape → Stylized Clouds**.

This will create a new *Stylized Clouds* GameObject in your scene.

Using Presets

Cloudscape includes **6 ready-to-use presets** to help you get started quickly.

To apply a preset:
Select the **Stylized Clouds** GameObject.
In the Inspector, locate the Cloudscape component.
Click the **preset icon** (small gear icon) at the top of the component.
Choose a preset from the list.

Customizing the Clouds

You can fully customize the look and feel of the clouds via the Inspector. Below is a description of each property:

Transform

Height – Adjusts the vertical position of the clouds in the sky.
Size – Controls the overall size of the cloud layer.

Form

Scale – Changes the size of individual clouds.
Density – Sets how dense or sparse the cloud coverage is.
Threshold – Cuts off low values in the noise, useful for shaping clouds when combined with fluffiness.
Fluffiness – Adds a soft, fluffy appearance to the clouds.
Warping Strength – Controls the distortion applied to fluffy clouds for a more natural look.
Thickness – Defines the vertical thickness of the clouds. Higher values make clouds more opaque and less "see-through."

Color

Main Color – Primary color of the clouds.
Secondary Color – Secondary tint to add depth and variation.
Opacity – Controls the overall transparency of the clouds.

Horizon

Horizon Fade Strength – Determines how strongly the clouds fade toward the horizon.
Horizon Start – Distance at which horizon fading begins.
Horizon End – Distance at which horizon fading ends.

Wind

Orientation – Direction of cloud movement.
Speed – How fast the clouds move across the sky.

Support

If you like the project, please take a minute and give us a rating in the Asset Store. This really helps us to create and improve our Unity Assets.

If you encounter any problems or errors, please contact us via email:
